Canning is a method used to preserve foods for long periods of time by packing them in airtight containers. This allows food to be shelf-stable and safe to eat for 1 to 5 years or longer. Canning was first developed in the late 18th century as a way to provide a stable food source for soldiers and sailors at war. Common canned foods include fruits, vegetables, beans, soups, meats and seafood. This report studies the Canned Food Manufacturing.

Convenience is the key factor driving the growth of canned food consumption across the world, coupled with increasing disposable income and the rising number of working women. Because of their hectic lifestyles, consumers' preference for convenience food products has grown in recent years. Due to the retention of high amounts of nutrients, color, and flavor, canned foods have become one of the most preferred preserved foods among consumers. Changes in lifestyles, coupled with increased expenditure on food and beverages, lead to a significant dietary transition among consumers, marked by increased demand for animal-sourced food, fats and oils, refined grains, and fruits and vegetables.
