The global Cantilever Vision Measuring Machine market size is predicted to grow from US\$ 322 million in 2025 to US\$ 461 million in 2032; it is expected to grow at a CAGR of 5.3% from 2026 to 2032.

In 2025, global cantilever vision measuring Machine production reached approximately 20541 units, the average price is 16 k usd/unit. Cantilever Vision Measuring Machine is a precision optical dimensional metrology system characterized by a single-side column or C-frame supporting the optical Z-axis above an open XY measuring stage. The machine integrates a granite or other high-stability base, precision linear guides and scales, CCD/CMOS imaging, telecentric or zoom optics, programmable surface and contour illumination, motion control and dimensional measurement software to perform non-contact measurement of lengths, diameters, angles, positions, profiles and geometric tolerances. Automatic configurations typically combine CNC XYZ positioning, autofocus, automatic lighting and programmable inspection routines, while higher-specification systems may integrate touch probes or laser sensors for 2.5D and 3D measurement. The research scope focuses on dedicated cantilever or structurally equivalent C-frame vision measuring machines used in electronics, semiconductor components, precision machining, automotive parts, molds, medical components and other dimensional quality-control applications. ISO 10360-7 provides acceptance and reverification principles for Cartesian coordinate measuring machines using imaging probing systems, forming an important metrological reference for higher-accuracy vision measurement platforms.
