Capacitive Moisture Sensor is a type of sensor that measures the moisture content of a material or environment by detecting changes in capacitance caused by the variation in dielectric constant between two conductive plates, typically separated by a hygroscopic dielectric material. As the moisture level in the surrounding medium increases, the dielectric constant of the material between the plates changes, altering the capacitance, which is then converted into a measurable electrical signal proportional to the moisture content. These sensors are widely used in agriculture, industrial processes, environmental monitoring, and consumer electronics due to their high sensitivity, fast response time, and ability to operate in a wide range of temperatures and humidity levels.
