## Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

Capacitive torque sensor is a sensor that measures torque by measuring the effect of torque on the sensor's internal structure, such as an elastically deformed spring or elastomer. When torque acts on the sensor, the structure inside the sensor will undergo slight deformation, causing the capacitance inside the sensor to change. This change can be converted into an electrical signal and processed and measured through the corresponding circuit to obtain the torque value.

The global Capacitive Torque Sensor market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
