A Capacitive Touchscreen Stylus is a pen-like input device designed to work with capacitive touchscreens, which are the most common type of display used in smartphones, tablets, and modern laptops. Unlike resistive styluses that rely on pressure, capacitive styluses function by conducting the small electrical charge from a user's hand to the screen, mimicking the natural touch of a finger. They often feature conductive tips made of materials like rubber, mesh, or advanced fine-point conductive fibers, and some models include active electronic components for enhanced precision, palm rejection, and pressure sensitivity. Capacitive styluses are widely used for writing, drawing, navigation, and creative applications, offering users greater accuracy and control compared to finger touch.
