Capacitive Transducer is an instrument that reflects the transformation of other quantities as changes in capacitance. It is mainly composed of upper and lower electrodes, an insulator, and a substrate. Under pressure, the film produces a certain deformation, and the distance between the upper and lower stages changes, resulting in a change in capacitance, but the capacitance does not change linearly with the change in the distance between the electrodes. The measurement circuit is required to perform certain nonlinear compensation on the output capacitance.
