The global Capacitor Base Film market size is predicted to grow from US\$ 1399 million in 2025 to US\$ 2440 million in 2032; it is expected to grow at a CAGR of 8.8% from 2026 to 2032.

Capacitor Base Film refers to electrical-grade polymer films used as the dielectric substrate in film capacitors before or after metallization. The product scope mainly covers BOPP polypropylene capacitor films, PET polyester capacitor films, and higher-temperature specialty films such as PPS and PEN, with BOPP being the dominant material for power electronics, electric vehicles, photovoltaic inverters, wind power, grid equipment, motors, appliances, and industrial power supplies because of its low dielectric loss, high insulation resistance, thickness uniformity, and compatibility with self-healing metallized capacitor designs. In 2025, Global Capacitor Base Film recorded estimated sales volume of about 260 kilotons, with an average selling price of around USD 5,500 per ton.

The growth of the Capacitor Base Film market is primarily driven by the shift of power-electronic systems toward higher voltage, higher switching frequency, higher power density, and longer operating life. Electric vehicle traction inverters, onboard chargers, DC/DC converters, photovoltaic and wind inverters, energy-storage PCS, HVDC transmission, industrial drives, and high-voltage power supplies for AI servers all require film capacitors for DC-link support, filtering, snubbing, and pulse discharge. As film capacitors become smaller, lighter, and more heat-resistant, capacitor base films are required to become thinner, more thermally stable, higher in breakdown strength, and lower in dielectric loss, pushing the market toward ultra-thin, high-temperature, and high-reliability grades.
