Capacitor energy storage spot welding machine is a device that uses the rapid discharge of capacitor banks to generate large currents for resistance welding. Its working principle is to first store electrical energy in high-voltage capacitors, and then release it instantly during welding, generating pulse currents of thousands to tens of thousands of amperes in a very short time (milliseconds), causing the metal contact surface to partially melt and form welds. This technology has the advantages of concentrated energy, fast welding speed, and small heat-affected zone, and is suitable for precision electronics, battery manufacturing, automotive wiring harnesses, and precious metal welding.
