The global Capsule Thermal Energy Storage Tank market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

The capsule phase change heat storage system is a unique new heat storage solution. The heat storage device using this technology will not need to adopt the current conventional double tank design (hot tank and cold tank), and only use a single tank. A single tank can achieve heat storage and heat transfer at the same time. Compared with the two-tank molten salt heat storage system commonly seen in current solar thermal power stations, the heat capacity per unit volume of this capsule phase change molten salt heat storage system can be 50% higher. . The key to realizing the heat transfer and storage technology in a single tank is that the capsule must provide sufficient internal space when the molten salt inside melts and expands. Phase change molten salt is a high-temperature material with special thermal conductivity that has special photosensitivity and can quickly charge and release heat. It is made of a variety of different molten salts in a certain proportion. It can be selected according to the actual operating temperature needs. Material ratio. Encapsulating this phase change material in a small capsule-shaped sphere can effectively solve the corrosion problem of the heat storage box caused by the phase change material.

United States market for Capsule Thermal Energy Storage Tank is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
