The global Car Active Noise Cancellation Algorithm market size is predicted to grow from US\$ 27.00 million in 2025 to US\$ 72.59 million in 2032; it is expected to grow at a CAGR of 12.8% from 2026 to 2032.

Active noise cancellation algorithms for automobiles are essentially an adaptive signal processing and control algorithm: They collect noise 'reference/error signals' through in-vehicle/body sensors (commonly microphones, accelerometers, etc.), calculate 'anti-noise' with equal amplitude but opposite phase to the noise in real time in the DSP/vehicle domain controller, and then use the vehicle's speakers to cancel out noise in the target frequency band (especially low-frequency road noise, tire noise, and some engine order noise). In engineering implementation, a feedforward/feedback/hybrid architecture is typically used, along with adaptive filtering (such as Filtered-x LMS) to track changes in vehicle speed, road surface, and vehicle structure transfer functions, thus balancing 'comfort improvement' with 'system stability/computing cost.' The global market size is estimated at around \$30 million by 2025.

United States market for Car Active Noise Cancellation Algorithm is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
