The car light controller is an important unit for car intelligence and automatic driving. It is an electronic device that can control a series of functions such as the start and stop, intensity, and steering of the lights. The car light controller can realize the automatic start and normal operation of body lights such as high/low beam lights, daytime running lights and turn lights through complex control logic and algorithms according to the signals transmitted by various sensors, and can Calculate the optimal lighting brightness and angle under various driving environments and road conditions such as road, uphill and downhill, turning, rainy and foggy days, passing traffic, etc., and actively provide the best lighting for the driver to ensure the driving safety of the driver.

In terms of the upstream and downstream of the industrial chain, the upstream

components of automotive electronic controllers include chips, sensors, passive devices, and circuit boards; the midstream is the design and manufacture of intelligent controllers; the downstream is automotive electronic terminal products. Upstream chips directly reflect technology applications and product performance.

At present, with the continuous development of automobiles in the direction of intelligence, networking, and electrification, the car light control system needs to meet more diverse and complex functions, and the demand for corresponding car light control difficulty is also increasing. The improvement of functional requirements drives the generational upgrade of car light controllers. The controller is the control core of the car light, and it needs to be responsible for the start-up and normal operation of the system, and it carries a large amount of tasks. With the increasing demand for car lights, the requirements for controllers are also increasing, and there are also intergenerational updates for the same product.
