Car seat slide rail is a mechanism for adjusting the front and rear displacement of the seat in the horizontal longitudinal position of the carriage. There is a single lock slide track and a double lock slide slide. The selection of the slide track is generally determined based on the lock strength. For example: when the seatbelt anchorage point is not in the seat, a single lockout slideway is generally selected; when the seatbelt anchorage point is in the seat, a double lockout slideway or a double lockup slideway is selected. The size of the slide displacement, that is, the distance between the front and the rear of the seat, must be determined according to the corresponding human body size and ergonomic principles. Generally, the distance before and after the adjustment is 0 to 100 mm.
