Abstracts

The global Car Sensorless Bluetooth Key and Ultra Wide Band (UWB) Key market size is predicted to grow from US$ 2292 million in 2025 to US$ 8433 million in 2032; it is expected to grow at a CAGR of 20.9% from 2026 to 2032.

In 2024, global production of in-vehicle contactless Bluetooth keys reached 18.251 million units, with an average selling price of $56.57 per unit. In 2024, global production of ultra-wideband (UWB) keys reached 1.6594 million units, with an average selling price of $71.42 per unit. Bluetooth Low Energy (BLE), Near Field Communication (NFC), and Ultra-Wideband (UWB) are the three primary technologies for digital keys. The first generation of digital keys was based on NFC, while the second generation employed Bluetooth Low Energy (BLE). The third generation combines UWB, BLE, and NFC. Compared to physical keys and first-generation NFC digital keys, in-vehicle contactless Bluetooth keys are typically used within a 15-meter range in open areas. They offer low power consumption and mature technology, but performance can vary depending on factors such as the phone used and environmental interference. Car owners can create a key by adding their phone number on the digital key management screen and downloading the app. Ultra-wideband (UWB) keys are based on the Bluetooth contactless car key function and add a precise ranging protocol. UWB keys offer more accurate ranging, a better user experience, and are compatible with Bluetooth car key functions. UWB keys are primarily based on chips, protocols, and standards. UWB chip suppliers include Apple, NXP, and Qorvo. Downstream automotive companies include BMW, NIO, and BYD. UWB's technical approach is to achieve ranging and positioning through the transmission and reception of ultra-wideband electromagnetic pulses. UWB generates key cryptographic keys, providing the highest level of protection against hardware or software attacks, thereby ensuring the highest level of security in locating the device to the vehicle.
