The global Carbide Modular Shank market size is predicted to grow from US$ 1278 million in 2025 to US$ 1741 million in 2031; it is expected to grow at a CAGR of 5.3% from 2025 to 2031.

A carbide modular shank is a key component in machining tools, mainly used to connect cutting tools and machine tool spindles. It is primarily made of carbide, which is a compound of carbon and one or more metallic elements, like tungsten carbide or titanium carbide. Carbide has high hardness, wear resistance, and heat resistance, enabling the shank to maintain good performance under high-speed and high-load machining conditions.

A carbide modular shank consists of multiple detachable modules, usually including a main shank body and connection parts. The main body provides the necessary strength and rigidity, while the connection parts are used to connect with different cutting tool heads or other tooling components, allowing for easy replacement and combination to meet various machining requirements. When the machine tool operates, the spindle rotates and transmits power to the carbide modular shank. The shank then drives the cutting tool connected to it to rotate, enabling the cutting tool to perform cutting operations on the workpiece. The modular shank has a precise positioning structure, which can accurately position the cutting tool relative to the machine tool spindle and the workpiece. This ensures the accuracy and stability of the cutting process, helping to improve machining precision and surface quality.

United States market for Carbide Modular Shank is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.
