The global Carbide Rod with Helical Coolant Holes market size is predicted to grow from US\$ 192 million in 2025 to US\$ 291 million in 2032; it is expected to grow at a CAGR of 6.3% from 2026 to 2032.

Carbide Rod with Helical Coolant Holes refer to cylindrical carbide rods featuring internal, helical hollow channels running through their length; they are fabricated from materials such as tungsten carbide and cobalt via a powder metallurgy sintering process. These rods are primarily utilized in the manufacture of high-performance rotary cutting tools, such as drill bits and reamers.

The upstream sector primarily involves raw materials such as tungsten carbide powder, cobalt powder (or nickel-cobalt binders), grain growth inhibitors, forming aids, and protective sintering atmospheres. Among these, tungsten carbide determines the material's hardness and wear resistance, while the cobalt phase dictates its toughness and impact resistance; furthermore, the grain size?in conjunction with the binder ratio?collectively influences the subsequent cutting tool's strength, edge stability, and service life. The midstream sector transforms these materials into rod blanks through a series of processes including mixing, extrusion molding, spiral-hole formation, degreasing and sintering, straightening, cutting, and precision grinding. The downstream sector primarily feeds into the manufacturing of solid carbide internal-cooling drill bits, deep-hole drills, gun drill blanks, reamers, and select internal-cooling milling cutters, ultimately serving high-efficiency hole-machining applications across industries such as automotive, aerospace, mechanical manufacturing, mold making, and energy equipment.

In 2025, global sales volume is projected to reach approximately 2,000 tons, with an

average selling price of approximately \$98 per kilogram and a gross profit margin ranging from 32% to 42%.
