Conductive additives are effective for enhancing electronic transport. Conductive additives make the ionic transport and interfacial reaction sluggish. Critical cell degradation factors are identified by impedance decoupling. Commonly used battery conductive additives include traditional conductive additives (such as carbon black, conductive graphite, carbon fiber, etc.) and new conductive additives (such as carbon nanotubes, graphene and their mixed conductive slurries, etc.). Carbon-based conductive additives can be divided into conductive graphite, conductive carbon black, chopped carbon fiber, carbon nanotubes and graphene.

The global Carbon-based Conductive Additives market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
