Carbon ceramic composite is a new type of composite material, which consists of carbon fiber as reinforcement and silicon carbide as continuous matrix. Carbon ceramic composites have the dual advantages of carbon and ceramics. They not only have the advantages of high-performance ceramics, such as high strength, high modulus, high hardness, impact resistance, oxidation resistance, high temperature resistance, acid and alkali resistance, small coefficient of thermal expansion, and light specific gravity, but also overcome the shortcomings of general ceramic materials, such as large brittleness and single function. They are recognized as one of the ideal high-temperature structural materials and friction materials. This paper mainly studies the carbon ceramic composite brake disc for rail transit braking.
