The global Carbon Ceramic Resistor market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

A carbon ceramic resistor is a type of fixed resistor that uses a mixture of carbon particles and ceramic material as the resistive element. The ceramic material provides a stable structure while the carbon acts as the conductive path. This combination allows for good thermal properties and durability.

The construction typically involves mixing carbon granules with a ceramic binding material; this mixture is then molded into a particular shape and fired at high temperatures. After firing, the resulting component is a resistor that can withstand high temperatures and has a predictable resistance over a broad range of operating conditions.
