## Abstracts

The global Carbon-coated Foils market size is predicted to grow from US\$ 1282 million in 2025 to US\$ 2183 million in 2032; it is expected to grow at a CAGR of 8.4% from 2026 to 2032.

The typical gross profit margin for Carbon-coated Foils is between 20% and 40%. Carbon-coated foils are functional current collector materials in which a thin conductive carbon layer is coated onto the surface of metal foils, typically aluminum foil for cathodes and copper foil for anodes in rechargeable batteries. The carbon coating improves interfacial conductivity between the metal collector and active materials, enhances adhesion, reduces contact resistance, and suppresses corrosion or side reactions. As a result, carbon-coated foils significantly improve rate capability, cycling stability, and high-temperature reliability of batteries, and are widely used in lithium-ion, sodium-ion, and next-generation solid-state battery systems. In 2025, global Carbon-coated Foils production reached approximately 122 k tons, with an average global market price of around US\$11267 per ton. The production capacity for Carbon-coated Foils in 2025 was approximately 140 k tons.

United States market for Carbon-coated Foils is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
