## Abstracts

The global Carbon Dioxide Pipeline market size is predicted to grow from US\$ 968 million in 2025 to US\$ 1534 million in 2032; it is expected to grow at a CAGR of 7.2% from 2026 to 2032.

In 2025, global Carbon Dioxide Pipeline approximately 15,953 km, with an average global market price of around US\$ 62 per m. Gross margin is about 49%. The cost is 32 usd. The Production is about 18,000 km. Carbon Dioxide Pipelines are specialized pipelines designed to transport carbon dioxide (CO<sub>2</sub>) over long distances, typically from industrial sources (such as power plants, refineries, or chemical factories) to storage sites or utilization locations. These pipelines are a key component of carbon capture, utilization, and storage (CCUS) systems, which aim to reduce CO<sub>2</sub> emissions by capturing and transporting CO<sub>2</sub> for either permanent storage (usually in geological formations) or for use in enhanced oil recovery (EOR) or other industrial processes.

### 1. Classification by CO<sub>2</sub> phase

CO<sub>2</sub> pipelines can be classified into gaseous CO<sub>2</sub> pipelines, liquid CO<sub>2</sub> pipelines, and supercritical CO<sub>2</sub> pipelines. Gaseous pipelines are mainly used for short-distance and low-pressure transport, while liquid pipelines serve medium-distance applications. Supercritical CO<sub>2</sub> pipelines dominate CCS projects due to high density, low volumetric flow rate, and superior transport efficiency.

### 2. Classification by application scenario

CO<sub>2</sub> pipelines can be categorised into industrial CO<sub>2</sub> pipelines, enhanced oil recovery (EOR) pipelines, and CCS/CCUS pipelines. Industrial pipelines supply CO<sub>2</sub> for

chemical and food industries, EOR pipelines inject CO<sub>2</sub> into oil fields to enhance production, and CCS/CCUS pipelines transport captured CO<sub>2</sub> to storage or utilisation sites, forming the backbone of carbon reduction infrastructure.

### 3. Classification by transport distance

From an engineering perspective, CO<sub>2</sub> pipelines can be divided into short-distance pipelines, medium-distance regional pipelines, and long-distance trunk pipelines. Short-distance systems often use gaseous or liquid CO<sub>2</sub>, while medium and long-distance pipelines predominantly adopt supercritical CO<sub>2</sub> for economic efficiency.

### 4. Classification by operating pressure

CO<sub>2</sub> pipelines can be grouped into low-pressure, medium-pressure and high-pressure systems. High-pressure pipelines are required for liquid and supercritical CO<sub>2</sub> transport, typically operating at 8–20 MPa in large-scale CCS projects.

### 5. Classification by network configuration

Structurally, CO<sub>2</sub> pipelines include point-to-point pipelines, gathering networks, and trunk pipeline systems. Point-to-point pipelines directly connect emission sources to storage sites, while trunk networks integrate multiple sources and destinations, resembling future regional carbon transport grids.
