With growing demand in downstream market and recovery from influence of COVID-19 and the Russia-Ukraine War, the Carbon Emission Continuous Monitoring System is forecast to a readjusted size of US\$ million by 2029 with a CAGR of % during review period.

The research report highlights the growth potential of the global Carbon Emission Continuous Monitoring System market. With recovery from influence of COVID-19 and the Russia-Ukraine War, Carbon Emission Continuous Monitoring System are expected to show stable growth in the future market. However, product differentiation, reducing costs, and supply chain optimization remain crucial for the widespread adoption of Carbon Emission Continuous Monitoring System. Market players need to invest in research and development, forge strategic partnerships, and align their offerings with evolving consumer preferences to capitalize on the immense opportunities presented by the Carbon Emission Continuous Monitoring System market.

Carbon Emission Continuous Monitoring System is a fixed or regional emission source monitoring system developed based on the current situation of carbon emission monitoring. It can continuously monitor the concentration and total emission of gaseous pollutants or particulate matter emitted by air pollution sources online, and monitor the front-end monitoring sites. The data is statistically analyzed to complete carbon emission monitoring, verification and early warning, to achieve accurate monitoring of

carbon emissions from key pollutant-emitting enterprises and key pollution sources, and to provide strong technical support for digital, intelligent, and online monitoring of carbon emissions. Compared with the carbon emission data of material accounting, the system uses real-time monitoring data to establish a carbon emission accounting method system based on monitoring data, which can further improve the accuracy and real-time nature of carbon emission accounting data.

Global climate warming is the most significant environmental problem currently facing mankind and one of the most complex challenges facing mankind in the 21st century. It is also the key to the world's energy prospects and has become an important factor affecting the world's economy and politics. The emission of greenhouse gases, mainly carbon, caused by human activities is the main cause of global warming. Generally, continuous emission systems (CEMS) can be used to monitor carbon emissions. The European Commission launched the EU carbon emissions trading system in 2005 to officially carry out CO<sub>2</sub> emission monitoring.
