The global Carbon Fiber Composite Spring (CFRP Spring) market size is predicted to grow from US\$ 784 million in 2025 to US\$ 2119 million in 2032; it is expected to grow at a CAGR of 15.6% from 2026 to 2032.

In 2024, the global production of carbon fiber composite springs was approximately 1.5 million to 3 million units, with an average selling price of approximately US\$10 to US\$800 per unit and a gross profit margin of approximately 40%. Single-line production capacity was approximately 50,000 to 100,000 units per year. A carbon fiber spring is an elastic element manufactured using the high specific stiffness (high stiffness/low density) and high fatigue strength characteristics of carbon fiber reinforced polymer (CFRP). It stores and releases energy through the elastic deformation of the carbon fiber composite material itself, thus achieving cushioning, shock absorption, or reset functions similar to traditional metal springs, but achieving revolutionary breakthroughs in performance, including lightweight design, long fatigue life, and corrosion resistance. The core of the upstream supply chain for carbon fiber springs lies in raw materials such as carbon fiber precursors and special epoxy resins; the midstream is the spring design and manufacturing process, which focuses on orienting fibers through composite material processes such as winding, layup, and curing to achieve optimal mechanical properties; its downstream applications are directly applied in high-performance automotive suspensions, aerospace actuation systems, industrial robots, and high-end sports equipment. Its demand stems from the downstream industry's pursuit of ultimate lightweighting, high fatigue life and dynamic performance: With the extremely high specific stiffness of carbon fiber materials (achieving a weight reduction of more than 70%) and near-infinite fatigue life (far exceeding that of metal springs), it can significantly improve the response speed, motion accuracy and energy efficiency of equipment, becoming a core component that breaks through the performance

bottleneck of traditional metals.
