The global Carbon Fiber Drone Propeller market size is predicted to grow from US\$ 299 million in 2025 to US\$ 490 million in 2031; it is expected to grow at a CAGR of 8.6% from 2025 to 2031.

The impact of the latest U.S. tariff measures and the corresponding policy responses from countries worldwide on market competitiveness, regional economic performance, and supply chain configurations will be comprehensively evaluated in this report.

Carbon fiber drone propeller is a drone propeller made of carbon fiber composite materials.

Carbon fiber drone propellers are lighter and significantly stronger than plastic. It produces less vibration due to its stiffness, and it sounds quieter too when spinning.

The specific strength (strength/density) of carbon fiber is much higher than that of metal and traditional composite materials, which can significantly reduce the weight of propellers and improve the endurance and maneuverability of drones. The fatigue resistance of carbon fiber is suitable for high-frequency rotation scenes and prolongs the life of propellers. Carbon fiber can effectively reduce vibration, improve flight stability and the quality of shooting (such as aerial photography).

Scenarios such as logistics, agricultural plant protection, and power inspection require high-durability and high-reliability propellers, and carbon fiber has become the first choice. Stealth, high-speed performance, and adaptability to harsh environments promote the application of carbon fiber propellers.

High-end aerial photography drones (such as some DJI models) pursue quietness and efficiency, and carbon fiber propellers have become a differentiated selling point.
