The global Carbon Fiber Paper for PEMFCs market size is predicted to grow from US\$ 676 million in 2025 to US\$ 2561 million in 2032; it is expected to grow at a CAGR of 21.1% from 2026 to 2032.

Carbon Fiber Paper for PEMFCs is the basic raw material used to manufacture the gas diffusion layer (GDL) of PEMFCs. It is made from high-strength carbon fibers through a papermaking process, possessing a porous and uniform fiber network that provides mechanical support and electronic pathways for the catalyst layer. The thickness, porosity, and fiber arrangement of the base paper are controllable to meet the process requirements of subsequent microporous layer (MPL) coating and hydrophobic treatment. Carbon fiber paper itself cannot be directly used in fuel cell stacks, but its performance directly affects the conductivity, gas distribution capability, water management efficiency, and power, durability, and overall performance of the final GDL (Gas Diode Layer). In 2025, global production of Carbon Fiber Paper for PEMFCs is estimated at approximately 9.68 million square meters, with a unit price of approximately US\$57.14-142.85 per square meter, an average price of approximately US\$71.42 per square meter, and a gross profit margin of approximately 9.38%-19.74%.

The global market for carbon paper for proton exchange membrane fuel cells has experienced rapid growth in recent years, primarily driven by the expanding applications of fuel cell electric vehicles (FCEVs) and stationary hydrogen energy systems. As the largest component of the GDL market, carbon paper plays a crucial role in achieving high power density, efficient water management, and long-term durability in PEMFC stacks. Currently, the market is dominated by Asia, particularly China, Japan, and South Korea, which are leading in the development of automotive PEMFCs and large-scale stationary power generation systems. With advancements in surface coating

technology, microporous layer design, and durable materials, manufacturers are able to increase unit prices, driving high value-added growth. With the rise of the green hydrogen economy in the future, the demand for carbon fiber paper for water electrolysis hydrogen production (PEM electrolyzer) will gradually increase, but fuel cells will still occupy the main market share, and this trend is expected to remain unchanged until at least 2030.
