Carbon Fiber Precursor is a type of material that is used to produce carbon fibers, which are high-strength, lightweight, and heat-resistant fibers that are widely used in various industries such as aerospace, automotive, sports, and energy. Carbon Fiber Precursor is usually a synthetic polymer that can be spun into filaments and then subjected to various treatments such as oxidation, carbonization, and graphitization to form carbon fibers. The most common types of Carbon Fiber Precursor are polyacrylonitrile (PAN), rayon, and pitch .

The industry trend of Carbon Fiber Precursor is influenced by the following factors:

The increasing demand for carbon fibers in various end-use industries, especially in the aerospace and automotive sectors, which require lightweight, strong, and durable materials for fuel efficiency, performance, and safety .

The growing research and development activities for improving the quality, performance, and cost-effectiveness of carbon fibers and precursor materials, which involve new technologies, processes, and innovations .

The emergence of new applications and markets for carbon fibers and precursor
