## Abstracts

The global Carbon Fiber Rebar market size is predicted to grow from US\$ 180 million in 2025 to US\$ 274 million in 2032; it is expected to grow at a CAGR of 6.4% from 2026 to 2032.

Carbon fiber reinforced polymer (CFRP) rebar is a high-performance composite material rebar made from carbon fibers as the reinforcing material and resin as the matrix, manufactured through a pultrusion process. It possesses excellent characteristics such as high specific strength, high elastic modulus, corrosion resistance, and light weight. Compared to steel rebar, carbon fiber rebar typically has a tensile strength 5-10 times higher.

The core of the upstream segment lies in high-performance carbon fiber precursor filaments and resin matrix. The precursor filaments are mostly made from polyacrylonitrile (PAN), and undergo pre-oxidation, carbonization, and graphitization treatments. Their strength and modulus directly determine the load-bearing capacity of the reinforcing material.

In 2025, global sales are projected to be approximately 7360 kilometers, with an average market price of approximately \$25 per meter. The industry's gross profit margin is expected to be in the range of 20%-35%.

Traditional steel reinforcement corrosion incurs trillions of dollars in maintenance costs annually, while carbon fiber reinforcement, with its superior chemical resistance and rust-proof properties, fundamentally addresses the structural durability challenges in harsh environments such as saline and deep-sea conditions. Simultaneously, the promotion of low-carbon building policies and green finance is injecting momentum into the industry. The high strength-to-weight ratio of carbon fiber reinforcement significantly reduces transportation and construction energy consumption, and its exceptionally long service

life substantially reduces the carbon footprint over its entire lifecycle.
