The global Carbon Fiber Underbody market size is predicted to grow from US\$ 783 million in 2025 to US\$ 1273 million in 2032; it is expected to grow at a CAGR of 7.3% from 2026 to 2032.

Carbon fiber underbody is a vehicle underbody protection and aerodynamic component made from carbon fiber reinforced polymer (CFRP) through processes such as molding and RTM. Their core function is to provide high-strength protection while reducing weight by more than 30% compared to traditional plastics or metals, thereby lowering the vehicle's center of gravity, improving handling stability, and reducing wind resistance and extending the driving range of electric vehicles by optimizing airflow. They solve safety hazards caused by the heavy weight of traditional underbody panels, such as a strong 'floating' feeling in crosswinds, severe body roll during cornering, and impact wear on the battery pack. Furthermore, the corrosion resistance of carbon fiber extends the service life of chassis components. The upstream supply chain begins with chemical raw materials such as acrylonitrile, which are polymerized and carbonized to produce carbon fiber tows, which are then combined with matrices such as epoxy resin to create intermediate materials such as prepregs or woven fabrics. Downstream, they are directly delivered to automotive OEMs (especially for new energy vehicles and high-performance cars) and the aftermarket, installed under the chassis on the assembly line to precisely wrap and protect core components such as the battery pack and motor. In 2025, the production of carbon fiber underbody will be approximately 160,000 units, with an average price of approximately US\$5,000 per unit, a gross profit margin of approximately 30%, and a single line capacity of 3,000 units per year.

United States market for Carbon Fiber Underbody is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
