The global Carbon Long Fiber Reinforced Polymer market size is predicted to grow from US\$ 520 million in 2025 to US\$ 721 million in 2032; it is expected to grow at a CAGR of 4.9% from 2026 to 2032.

Carbon Long Fiber Reinforced Polymer is a composite material consisting of carbon fibers as reinforcement and resin (polymer) as the matrix. This material possesses properties such as lightweight, high strength, high stiffness, and corrosion resistance. The raw materials include carbon fibers and a polymer matrix. Carbon fibers are typically produced by carbonizing polymers such as polyacrylonitrile (PAC) and pitch at high temperatures. Due to its high strength, high stiffness, lightweight, and corrosion resistance, it is widely used in aerospace, automotive, and sports and leisure industries.

Global sales volume in 2024 was approximately 170,000 tons, with an average market price of approximately US\$3,000 per ton. The scale of single-line production capacity varies depending on production processes and investment scale. Industry gross profit margins range from 15% to 30%.

Carbon Long Fiber Reinforced Polymer, as highly engineered materials, possess high specific modulus and high specific strength. They are ideally suited for applications requiring high strength and stiffness, low weight, and excellent fatigue properties. Carbon fiber has approximately ten times the specific strength of aluminum and steel. Demand is continuously growing in fields such as aerospace and automotive.

Carbon fiber has a high degree of surface inertness and limited compatibility with resins such as PP and PA. Surface treatment with sizing agents and coupling agents is

required to obtain a strong and tough interface. However, inadequate treatment can lead to delamination and brittle fracture, while overtreatment can worsen flowability and processability. Therefore, finding a balance between 'interface strength, processability, and cost' among different matrices (PA6, PA66, PPS, TPU, etc.) is a significant test of formulation ability.
