The global Carbon Nanotube Paste market size is predicted to grow from US\$ 2816 million in 2025 to US\$ 14973 million in 2032; it is expected to grow at a CAGR of 29.8% from 2026 to 2032.

Carbon nanotube paste is a liquid or slurry-like functional material prepared using carbon nanotubes (single-walled or multi-walled CNTs) as the main filler through dispersants, solvents, or resin systems. Its core function is to form a continuous conductive network or enhance material properties, improving electron transport efficiency, electrical conductivity, thermal conductivity, or mechanical properties, while also considering processability and compatibility with coating, printing, or composite processing techniques. Carbon nanotube pastes are widely used in lithium-ion batteries, electromagnetic shielding, printed electronics, conductive plastics, functional composite materials, and semiconductors. They can be optimized based on parameters such as CNT type, purity, diameter, specific surface area, and solid content to meet the performance requirements of different applications. In 2025, global shipments of carbon nanotube paste were approximately 640,200 tons, with an average price of approximately US\$4,496.8 per ton. The price of single-walled carbon nanotube paste was approximately US\$22,857.14 per ton, and that of multi-walled carbon nanotube paste was approximately US\$2,571.42 per ton, with gross profit margins ranging from 40% to 50%.

Conductive agents, as key auxiliary materials for lithium batteries, account for a limited percentage of the cost but have a significant impact on battery performance. Commonly used conductive agents for lithium batteries mainly include traditional conductive agents (carbon black, conductive graphite, carbon fiber, etc.) and novel conductive agents (carbon nanotubes, graphene, and their mixed slurries, etc.). With technological

maturity, carbon nanotube conductive slurries are gradually replacing traditional conductive agents, becoming the mainstream choice for power batteries and energy storage batteries. Due to their small proportion in the overall cost, customers are relatively less sensitive to CNT prices, giving them a stable market space in high-end applications. The future growth of carbon nanotube slurries will continue along with the development of the lithium battery and functional electronic materials market, driving the industry towards higher technological added value.
