The global Carbon Papers for PEMFCs market size is predicted to grow from US\$ 676 million in 2025 to US\$ 2561 million in 2032; it is expected to grow at a CAGR of 21.1% from 2026 to 2032.

Carbon Papers for PEMFCs are the basic raw materials used to manufacture the gas diffusion layer (GDL) of PEMFCs. They are made from high-strength carbon fibers through a papermaking process, possessing a porous, uniform fiber network that provides mechanical support and electronic pathways for the catalyst layer. The thickness, porosity, and fiber arrangement of the base paper are controllable to meet the process requirements of subsequent microporous layer (MPL) coating and hydrophobic treatment. Carbon paper itself cannot be directly used in fuel cell stacks, but its performance directly affects the conductivity, gas distribution capability, water management efficiency, and power, durability, and overall performance of the final GDL (Gas-to-Digital Fuel Cell). In 2025, global production of Carbon Papers for PEMFCs is estimated at approximately 9.68 million square meters, with a unit price of approximately US\$57.14-142.85 per square meter, an average price of approximately US\$71.42 per square meter, and a gross profit margin of approximately 9.38%-19.74%.

Carbon paper for proton exchange membrane fuel cells (PEMFCs) is the basic raw material used to manufacture the gas diffusion layer (GDL) of PEMFCs. It is made from high-strength carbon fibers through a paper-forming process, possessing a porous, uniform fiber network that provides mechanical support and electronic pathways for the catalyst layer. The thickness, porosity, and fiber arrangement of the base paper are controllable to meet the process requirements of subsequent microporous layer (MPL) coating and hydrophobic treatment. Carbon fiber paper itself cannot be directly used in fuel cell stacks, but its performance directly affects the conductivity, gas distribution

capability, water management efficiency, and power, durability, and overall performance of the final GDL (Gas Diode Ligating Diode), as well as the PEMFC (Potentially Electro-Mechanical Fuel Cell). In 2025, the global production of carbon paper for proton exchange membrane fuel cells is approximately 9.68 million square meters, with a unit price of approximately US\$57.14-142.85 per square meter, an average price of approximately US\$71.42 per square meter, and a gross profit margin of approximately 9.38%-19.74%.
