The global Carbonyl Fluoride(CF₂O) market size is predicted to grow from US\$ 34.91 million in 2025 to US\$ 58.81 million in 2032; it is expected to grow at a CAGR of 7.9% from 2026 to 2032.

Carbonyl Fluoride (COF₂) is a colorless, pungent, and highly reactive inorganic gas belonging to the family of fluorine-containing compounds. It serves as an important fluorinating agent and intermediate

The market volume of carbonyl fluoride is relatively small but strategically important in the high-end fluorochemicals sector. Only a few companies globally have the capability for its industrial-scale production, primarily in the U.S., and China

While the market size is modest, the outlook for carbonyl fluoride is strategically significant, especially in high-tech sectors:

Rising demand in semiconductors and electronic chemicals, where extreme etching and plasma processes require reactive fluorinated gases.

Expansion of advanced fluorinated pharmaceuticals and agrochemicals, demanding precise structural control and functional group introduction.

Upgrading of the fluoropolymer industry, where polymer and coating manufacturers require higher-purity and performance-oriented fluorinated monomers.

The industry faces high technology barriers:

High toxicity and corrosiveness: Requires specialized materials (e.g., Monel alloys, PTFE-lined systems) and fully enclosed setups, posing significant safety and engineering challenges.

Difficult control over raw materials and byproducts: Involves hazardous precursors like phosgene and HF, with complex side reactions requiring precise process control.

On-site consumption requirement: Due to its reactivity and instability, it is not easily stored or transported, limiting its tradability.

Strict environmental and regulatory controls: COF₂ is considered a potential greenhouse gas, and its emissions must be tightly controlled, increasing compliance costs.
