The global Carburized Steel market size is predicted to grow from US\$ million in 2025 to US\$ million in 2031; it is expected to grow at a CAGR of % from 2025 to 2031.

Carburizing steel is a kind of steel which has been carburized to improve its surface hardness and wear resistance. This process involves heating the steel to a high temperature in the presence of a carbon-rich atmosphere (usually carbon monoxide or methane gas). Carbon atoms diffuse to the surface layer of steel to form a layer of high carbon and high hardness, while maintaining a low carbon and tough core. Carburizing process is used to improve the surface hardness and wear resistance of steel, making it suitable for applications requiring high durability and wear resistance.
