Cardiac stabilizer is an important instrument used in coronary artery bypass surgery with beating heart. Its main function is to make an anastomosis by the suction force of the presser foot or only the pressure of the presser foot when the heart is beating. The surface of the heart where the coronary arteries are located is fixed locally, reducing the beating amplitude, creating a relatively stable operation area at the target blood vessel of the heart, and achieving the function of limiting and revealing the coronary anastomosis position.
