A cargo containment system for LNG (Liquefied Natural Gas) carriers is a complex and highly specialized structure designed to safely store and transport LNG. It is a sealed enclosure within the carrier's hull that is engineered to maintain the extremely low temperature of LNG (-162°C approximately) and withstand the pressure changes during the transportation process. This system is crucial for preventing LNG leakage and vaporization, which could lead to safety hazards such as explosions or fires. It typically consists of insulation materials to reduce heat transfer, primary and secondary barriers to contain the LNG, and various monitoring and control systems to ensure the integrity of the cargo and the safety of the vessel and its crew.
