The global Carina Balloon market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

The carina balloon is a special tool used in interventional treatment. Its design features are that the balloon surface or interior has structures such as ridges, protrusions or special cutting pieces. These special designs enable the balloon to produce more complex and precise mechanical effects when it is filled and expanded, thus having unique advantages in treating vascular stenosis and lesions. The design focus of the carina balloon is on the ridges, protrusions or special structures inside its surface. These designs can be simple protrusions or complex cutting pieces. Their function is to improve the expansion effect of blood vessels through different mechanical mechanisms when the balloon is filled. Carina balloons are widely used in interventional treatment fields such as cardiovascular, cerebrovascular, and peripheral blood vessels. In PCI (percutaneous coronary intervention) surgery, carina balloons are often used for pre-expansion and post-expansion to improve the implantation effect of stents. In addition, it also has important application value in interventional treatments such as cerebrovascular diseases and peripheral vascular diseases.

As the number of patients undergoing PCI (percutaneous coronary intervention) surgeries increases, the demand for special balloons, including protuberance balloons, is also increasing. This is because special balloons have significant advantages in dilating narrowed blood vessels, reducing vascular damage, and reducing the incidence of complications. The protuberance balloon, through its unique design, such as with protrusions or cutting pieces, can more accurately transmit pressure to the inner wall of the blood vessel when the balloon is filled and expanded, achieving more effective vascular dilation and meeting the clinical demand for better treatment effects. The protuberance balloon technology continues to develop and its comprehensive performance continues to improve. From the initial simple design to today's various

types, such as cutting balloons and spinous process balloons, more options are provided for clinical treatment. With the progress in materials science, biomedical engineering and other fields, the manufacturing process and material selection of protuberance balloons have also been significantly improved, further improving the safety and effectiveness of the product. In summary, the protuberance balloon market will maintain a growth trend at present and in the future.
