The global Carlens Double-Lumen Tube market size is predicted to grow from US\$ 37.03 million in 2025 to US\$ 49.33 million in 2032; it is expected to grow at a CAGR of 4.3% from 2026 to 2032.

Carlen double-lumen tube, full name Carlen double-lumen endobronchial tube, is a medical device specially designed for thoracic surgery and requires double lung isolation and one-lung ventilation (OLV) technology. The catheter was designed by Carlens in 1949 and first used in clinical practice. It is mainly used to measure the difference in vital capacity between different bronchi and was subsequently widely used for airway management in thoracic surgery anesthesia. The Carlen double-lumen tube has two independent cavities, corresponding to the left and right common bronchi, so that doctors can control the ventilation of each lobe individually as needed during surgery. The Carlen double-lumen tube consists of left and right double cavities, two cuffs and a carina hook. The left tube opens at the front end and is inserted into the left main bronchus; the right tube opens on the right tube wall 6 to 8 cm from the front end, and a tongue-shaped carina hook is provided below to straddle the carina to ensure the stability of the catheter position. The main function of the catheter is to achieve lung isolation and single-lung ventilation, provide a clear surgical field for thoracic surgery, and reduce the interference of surgery on the unoperated lobe. In addition, the Carlen double-lumen tube can also be used for bilateral lumen ventilation of inhaled anesthetic gas, and to remove secretions from both lobes at any time.

With the continuous advancement of medical technology and the increase in surgical needs, double-lumen tubes are increasingly used in thoracic surgery, anesthesia, and intensive care. As one of the representative products in this field, the market demand for Carlen double-lumen tubes continues to grow. The rising incidence of lung cancer,

cardiovascular disease, and other thoracic diseases has driven the demand for surgical operations that require the use of double-lumen endobronchial tubes. In addition, with the aging of the global population and the continuous advancement of medical technology, the market demand for medical devices such as double-lumen tubes will continue to grow. At the same time, the popularization of minimally invasive surgical techniques and patients' demand for high-quality medical services will also promote the development of high-end medical devices such as Carlen double-lumen tubes. In summary, as one of the important products in the field of medical devices, the market development status and dynamics of Carlen double-lumen tubes show a positive trend, and the market prospects are very broad.
