The global Carrier Activated Carbon market size is predicted to grow from US$ 661 million in 2025 to US$ 946 million in 2032; it is expected to grow at a CAGR of 5.4% from 2026 to 2032.

Carrier activated carbon is a functional composite material that uses activated carbon as a matrix (carrier) and loads active components through physical adsorption or chemical methods. Its highly developed pore structure and large specific surface area provide an excellent platform for the dispersion and immobilization of active substances, enhancing the stability and utilization of active components while also combining the adsorption properties of activated carbon with the catalytic, reactive, or sustained-release properties of the loaded substances. This material is widely used in industrial catalysis, environmental protection (such as VOCs control), chemical energy storage, drug sustained-release, and electrochemistry, serving as a key support material for achieving synergistic adsorption-catalysis effects.In 2024, the global production of carrier-type activated carbon will reach 792,870 tons, with an average selling price of US$810 per ton.

United States market for Carrier Activated Carbon is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.

China market for Carrier Activated Carbon is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.

Europe market for Carrier Activated Carbon is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
