A cartridge water purifier is a device that can easily purify water by simply connecting it to a water tap.

The installation of a DI water purifier does not require complicated construction, so the hurdle for installation is very low. Activated carbon pretreatment filters and ion exchange resins are used to purify pure water by removing impurities such as iron, manganese, and calcium contained in the water supply.

These filters and resins need to be replaced periodically, but because they are cartridge-type, they can be replaced with a simple operation. Because they are thus very easy to handle, they are used in research facilities and general households.

The global Cartridge Water Purifier market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
