## Abstracts

The global Cast Film Lines market size is predicted to grow from US\$ 47054 million in 2025 to US\$ 72635 million in 2032; it is expected to grow at a CAGR of 6.4% from 2026 to 2032.

In 2025, global sales of cast film lines reached 26,000 units, with an average selling price of US\$1.85 million per unit. A cast film line is a continuous manufacturing system that utilizes a melt extrusion process; plastic raw materials (such as PE, PP, and PET) are plasticized within an extruder, cast into shape via a die head, and then rapidly cooled and solidified by cooling rollers. Characterized by excellent thickness uniformity, high transparency, and high production efficiency, these lines are widely applied in fields such as food packaging, medical packaging, lithium-ion battery separators, and optical films. The upstream supply chain primarily comprises polymer resins, precision die heads, extruder components, roller systems, and automated control systems; the downstream market mainly targets packaging enterprises, new energy material companies, and electronic material manufacturers. The total global production capacity for cast film lines stands at approximately 32,000 units per year, with the industry maintaining a gross profit margin of roughly 25% to 33%. Looking ahead, driven by growing demand for high-barrier, multi-layer co-extruded, and functional films, cast film technology is poised for continued expansion within the lithium-ion battery separator and optical film sectors. Concurrently, the increasing adoption of eco-friendly and biodegradable materials will spur equipment upgrades and replacements, creating significant room for growth and investment opportunities as the industry advances toward high-end, intelligent, and energy-efficient solutions.
