Transformers are one of the main equipment in wind farms. Wind power generation needs to pass through substations before it can be connected to the grid. Wind farm substations are mainly equipped with transformers, distribution devices and control equipment, etc., which are used to increase voltage, control the gathering and transmission of power generated by wind turbines. The step-up transformer realizes the voltage conversion from the wind turbine outlet voltage of 690V to 35kV/10kV (with the increase of wind turbine unit capacity, the voltage on the low and high voltage sides will also be further increased), reducing the loss of wind turbine output power during transmission. Depending on the capacity of the wind turbine, it may be placed inside or outside the wind turbine tower. Epoxy cast dry-type transformers use epoxy resin as the insulation material. The high and low voltage windings are wound with copper strips (foils), and epoxy resin is cast and cured in a vacuum to form a high-strength fiberglass structure. The insulation grades are F and H. Epoxy resin dry-type transformers have the characteristics of good electrical performance, strong lightning impact resistance, strong short-circuit resistance, small size and light weight. A temperature display controller can be installed to display and control the operating temperature of the transformer winding to ensure the normal service life of the transformer.
