## Abstracts

Castable, also known as refractory castable, is a granular and powdery material made of refractory material with a certain amount of binder. It has high fluidity and is an amorphous refractory material formed by casting. Compared with other unshaped refractory materials, the binder and moisture content are higher, and the fluidity is better, so the application range of the castable is wider, and the materials and binders used can be selected according to the conditions of use. It can be directly poured into a lining body, and can also be used as a prefabricated block by pouring or shaking.
