Proton exchange membrane fuel cell, also known as solid polymer electrolyte fuel cell, is a fuel cell that uses hydrogen containing fuel to interact with air to generate electricity and heat. Its operating temperature is 50 °C to 100 °C, and there is no need to pressurize or decompress. With polymer proton exchange membrane as the transmission medium, there is no chemical liquid, and pure water and heat are generated after power generation. The catalyst helps to promote the reaction of the two electrodes in the fuel cell stack, and efficiently generates energy and water from hydrogen and oxygen under various conditions. In this paper, the catalysts used in proton exchange membrane fuel cells are mainly studied.
