Catalyst Evaluation and Testing Instruments refer to specialized laboratory and pilot-scale equipment used to evaluate, test, and optimize catalyst performance during catalyst development, process research, and industrial application studies. These instruments are designed to measure key catalyst parameters including activity, selectivity, stability, lifetime, reaction kinetics, and conversion efficiency under controlled reaction conditions. A typical system integrates reactors, reactant feeding units, temperature and pressure control systems, online analytical modules, and data acquisition software to simulate industrial reaction environments and provide reliable experimental data for catalyst screening, performance validation, process optimization, and scale-up studies. Catalyst Evaluation and Testing Instruments are widely applied in petrochemical, refining, chemical processing, environmental catalysis, hydrogen energy, fuel cell, and advanced material research fields.
