Phthalic anhydride catalyst is a chemical catalyst used to accelerate the oxidation reaction of o-xylene or naphthalene in the production process of phthalic anhydride. It is usually composed of active components such as vanadium oxide or molybdenum oxide and carriers such as alumina or silica. It reduces the activation energy of the reaction, allowing the raw materials and oxygen to efficiently produce phthalic anhydride at a lower temperature while minimizing the generation of by-products. The selectivity and activity of phthalic anhydride catalyst directly affect the yield, energy consumption and economy of phthalic anhydride, and it is a key material in the industrial production of phthalic anhydride.
