A Catalytic Thermal Oxidizer is a type of pollution control equipment, that is used to abate industrial exhaust streams, laden with volatile organic compounds (VOCs). Also known as a CO, CATOX, CTO, RCO, or CRO, a Catalytic Thermal Oxidizer works by raising the temperature of the exhaust stream to a point in which the chemical bonds that hold the VOC molecules together are broken (oxidized) across the precious metals from the catalyst media. The VOCs from the process exhaust stream are converted to carbon dioxide (CO<sub>2</sub>), water (H<sub>2</sub>O), and thermal energy. In a Catalytic Thermal Oxidizer, the operating temperature is substantially less than straight thermal oxidation, and when combined with a VOC loading level from the process stream, the system can become self-sustaining; often requiring minimal auxiliary fuel to support operation.
