Abstracts

The global Cathode Current Collector market size is predicted to grow from US\$ 2003 million in 2025 to US\$ 3730 million in 2032; it is expected to grow at a CAGR of 9.3% from 2026 to 2032.

A cathode current collector is a highly conductive metal substrate used in lithium-ion, sodium-ion, and other secondary batteries to support the cathode active material and to collect and conduct electrons; it is a critical component of the cathode electrode. Its primary function is to efficiently transport electrons—generated or received by the cathode active material—to the external circuit during charge and discharge cycles, while providing mechanical support for the cathode coating and ensuring the electrode possesses good electrical conductivity, dimensional stability, and processability.

The upstream segment of the industry chain primarily encompasses raw and auxiliary materials such as high-purity aluminum ingots, recycled aluminum, aluminum alloy materials, rolling oils, lubricants, and surface treatment agents, as well as key production equipment including melting and casting units, hot rolling mills, cold rolling mills, foil rolling mills, annealing furnaces, slitting equipment, and online inspection systems. The midstream segment consists of the manufacturing of battery-grade cathode current collectors (predominantly battery aluminum foil); through processes such as melting and casting, hot rolling, cold rolling, foil rolling, annealing, cleaning, slitting, and surface treatment, high-precision battery aluminum foil—typically 6–20 μ m thick—is produced. Some products undergo further functional modification using carbon, conductive, or ceramic coatings to enhance electrical conductivity, active material adhesion, and cycle stability. The downstream segment primarily involves applications in energy storage batteries, power batteries, and consumer electronics batteries.

In 2025, global sales volume for cathode current collectors reached 448,000 tons, with a production capacity of approximately 600,000 tons; the average selling price was \$4,571 per ton, and the average gross profit margin ranged from 15% to 20%.

Global policies supporting the new energy industry continue to drive the rapid growth of the market for cathode current collectors. China has consistently rolled out industrial support policies targeting new energy vehicles, advanced energy storage, and advanced materials, fueling a rapid expansion in new production capacity for battery aluminum foil; meanwhile, regions such as Europe, the United States, and Japan are accelerating the development of local battery material ecosystems through industry support schemes, incentives for localized manufacturing, and supply chain restructuring. At the same time, as concepts regarding green manufacturing, low-carbon aluminum, and the circular economy gain traction, the industry is placing greater emphasis on low-energy rolling processes, the utilization of recycled aluminum, and the application of smart manufacturing technologies to enhance product competitiveness and sustainability.
