The global Cathode Prelithiation Technology market size is predicted to grow from US$ million in 2025 to US$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

Pre-lithiation of the cathode is to add active lithium to the cathode in advance to release lithium ions to the cathode and supplement the irreversible capacity during the first charge and discharge process. This method aims to enhance battery performance and mitigate issues like capacity degradation and slow activation. By preloading lithium into the cathode, the technology seeks to improve the overall efficiency and energy density of the battery, leading to faster charging times and extended cycle life. There are mainly methods such as additives and excessive lithiation of positive electrode materials.

The market for prelithiation technology is experiencing notable growth as it addresses challenges in the lithium-ion battery industry. Prelithiation involves the addition of lithium to battery materials before cell assembly, enhancing performance and mitigating capacity degradation issues. The technology is gaining traction in electric vehicle (EV) and energy storage applications. As demand for high-performance batteries intensifies, manufacturers are investing in prelithiation methods to improve energy density and lifespan. Future developments are expected to focus on refining prelithiation processes, optimizing materials, and integrating the technology seamlessly into existing battery manufacturing workflows. The market?s evolution is closely tied to advancements in battery technologies, with prelithiation poised to play a crucial role in enhancing the overall efficiency and reliability of lithium-ion batteries across various industries.
