The report requires updating with new data and is sent in 48 hours after order is placed.

Cationic lipids have the ability to form aggregate complexes with anionic genetic materials such as DNA or RNA. These aggregated liposomal structures have a positive surface charge when in aqueous solutions. The positively charged surface mediates the interaction of RNA and the cell membrane and allows the introduction of RNA to the cell due to the inability to distinguish the liposome from the cell membrane. Advantages of cationic lipid-mediated transfection include high efficiency, ability to transfect a wide range of cell types, reproducibility, low toxicity, and simplicity.
