In flotation, a surface-active substance that has the active constituent in the positive ion. Used to flocculate and to collect minerals that are not flocculated by the reagents, such as oleic acid or soaps, in which the surface-active ingredient is the negative ion. Reagents used are chiefly the quaternary ammonium compounds; e.g., cetyl trimethyl ammonium bromide.

Cationization of cotton has emerged as an effective and efficient tool for the dyeing industry as it helps negate the environmental problems associated with use of anionic dyes. Cationized cotton offers several advantages over conventional cotton including improved bleach rate, avoiding color bleeding effect, and offering migration index with significant SEF. The process of cationization also makes cotton suitable for use with acid dyes, which is not possible by using any alternative process.

Cationized cotton dyed with acid dyes are much better choice than cotton dyed with reactive dyes, in terms of properties and dyeing effects. Furthermore, this process is more environment-friendly. Thus, there is significant demand for cationizing agents from the dyeing industry, and this factor maintained the sales of CHPTAC as a popular cationizing agent in the dyeing industry.
