Cauterization is a medical procedure in which there is burning of the part of the body or a close part of the bod is removed. Some of tissues are destroyed in attempt to stop bleeding and to avoid any other serious complications or avoid any infections when antibiotics are not available. Earlier cauterization process used was very dangerous a simple metal piece was hated over the fire and applied to the wound thus this caused the blood to rise at very higher temperatures and the blood coagulated and hence the bleeding stopped. But this method caused extensive loss to the surrounding tissues hence this method was prohibited in many areas .The new method used was electrocautery. There are new devices developed for the process of cauterization.Abu Al-Qasim Al-Zahrawi develop instruments for the process for cauterization. In electrocautery there is a proper metal probe which is sterilized properly and there is a temperature controller and proper care is taken not to damage the tissues of the surrounding areas. The current can be passed in unipolar way, bipolar way or in the

wave form.
